FAILURES

### The second binding, confirmed

The dual signature over the sealed root verifies (Ed25519 + ML-DSA-65)

The sealed root derives from the register's own content

Changing one register line breaks the signature (tamper-evident)

### The self-verifying capsule

Sealed as `OBSIDIAN.capsule.json` — it carries the full root, both signatures, and the public keys, so a stranger verifies the exact seal without re-running anything.

```
sealed root (SHA-256 Merkle) · 47c3d8977cadd8171eaebe0577fef19ec46d17fdf3098e56d78965f1ab69e024
capsule fingerprint (SHA-256) · cb65fdd35c731cb7b02c2a7b2b27ede8e3b77b2fcd65a71fb9bf8ed30017be8c
```

*This is the second of three provings, each run and sealed on its own day. The final — the Final Verification for Certification, sealed 30 July 2026, rebuilt from nothing — is recorded with all three in the Manifest of Proof.*
